

Retinitis Pigmentosa: Causes, Tests, and Treatment Options

Retinitis pigmentosa, or RP, is when there is retinal damage caused by genetic defects. The cells controlling that night vision, or rods, are damaged and so are the retinal cone cells. There can be dark deposits in the retina. This condition can also be known as rod-cone dystrophy, or progressive pigmentary retinopathy. It was first mentioned in 1855 by the Dutch ophthalmologist Franziscus C. Donders. The condition affects night vision among other visual disorders and can lead in some cases to total blindness. Some of the most severe signs do not happen until early adulthood. Symptoms of RP include tunnel vision, night blindness, glare or light problems, double vision, cataracts, and decreased visual acuity. While there is no cure for RP, several treatment options are available to help you manage the disease.

Rods and cones explained Symptoms of retinitis pigmentosa (RP) Tunnel vision Cataracts Types of retinitis pigmentosa Diagnosis of retinitis pigmentosa Amazon?????Retinitis Pigmentosa: Causes, Tests, and Treatment Options?????????Amazon?????????????James Henry?????An eye doctor (ophthalmologist) can tell you if you have retinitis pigmentosa.
